Lets Upgrade

Assignment 1:

Explain Machine Learning with your own example.

Ans. Machine learning is something where we train the model about some tasks based on the data.

One simple example of this will be the food delivery system. When we are in a home and want to order something online using an app like Domino'z (let's say). When a user is only selecting the toppings for its pizza, the app predicts the possibility or probability of a user ordering the pizza. And, when a user is just paying for its order, the order gets ready from the oven in the shop, and as soon as the payment is made the pizza is already sent for delivery. In this way, the user enjoys the fastest delivery facility. And all this happens only due to machine learning and its data on which it is trained.
